WATCH IT. UNDERSTAND IT. DO IT.

Learn your skin.

An AI skincare learning companion that turns fragmented tutorials into a routine you can perform and reproduce on your own.

Fragmented

Tutorials are scattered, so viewers cannot assemble a complete routine.

Watching is not doing

People follow the video but cannot carry out the steps by themselves.

Not personal, not sourced

Products may not fit skin or budget, and creator claims are hard to trust.

THE IDEA

From watching to doing.

Watch · Understand · Personalize · Practice · Complete · Review · Reuse

Source vs. inference

Every step is labelled as stated in the tutorial or inferred by AI. No invented products, ingredients or timestamps.

Personalised

Steps adapt to skin type, sensitivity, budget and products already owned: use it, skip it, or fill the gap with a category.

Guided practice

An AI mentor answers inside the current step only, through five actions such as Why this step? and Can I skip this?

Honest progress

Self-reported, quiz-passed and independent completion are tracked separately. Only independent runs count toward the completion rate.

STATUS

What is real today.

Built in code

- Text tutorial to structured steps (server-side AI, schema-validated)
- Email login and per-user storage with row-level security
- Rule-based personalisation
- AI mentor Q&A inside the current step
- AI-generated comprehension check
- Progress dashboard with three completion levels

Unit-tested and type-checked. Not yet verified end to end against live services.

Not built yet

- Video, link and screenshot analysis
- Trusted knowledge base with real sources and evidence levels
- Product ingredient database
- Camera-based live guidance

The live demo uses clearly labelled sample data, not real analysis.

TRY IT

See it, then check the code.

Source code https://github.com/li5189518-lang/skinpilot-ai

What we test next

Add a trusted knowledge base so every key claim shows its source and evidence level.

Process video tutorials through an asynchronous queue.

Run user tests: can a learner finish the routine unaided?
